

Isoline Map

Chaitanyasuma Jain

What is an Isoline Map?

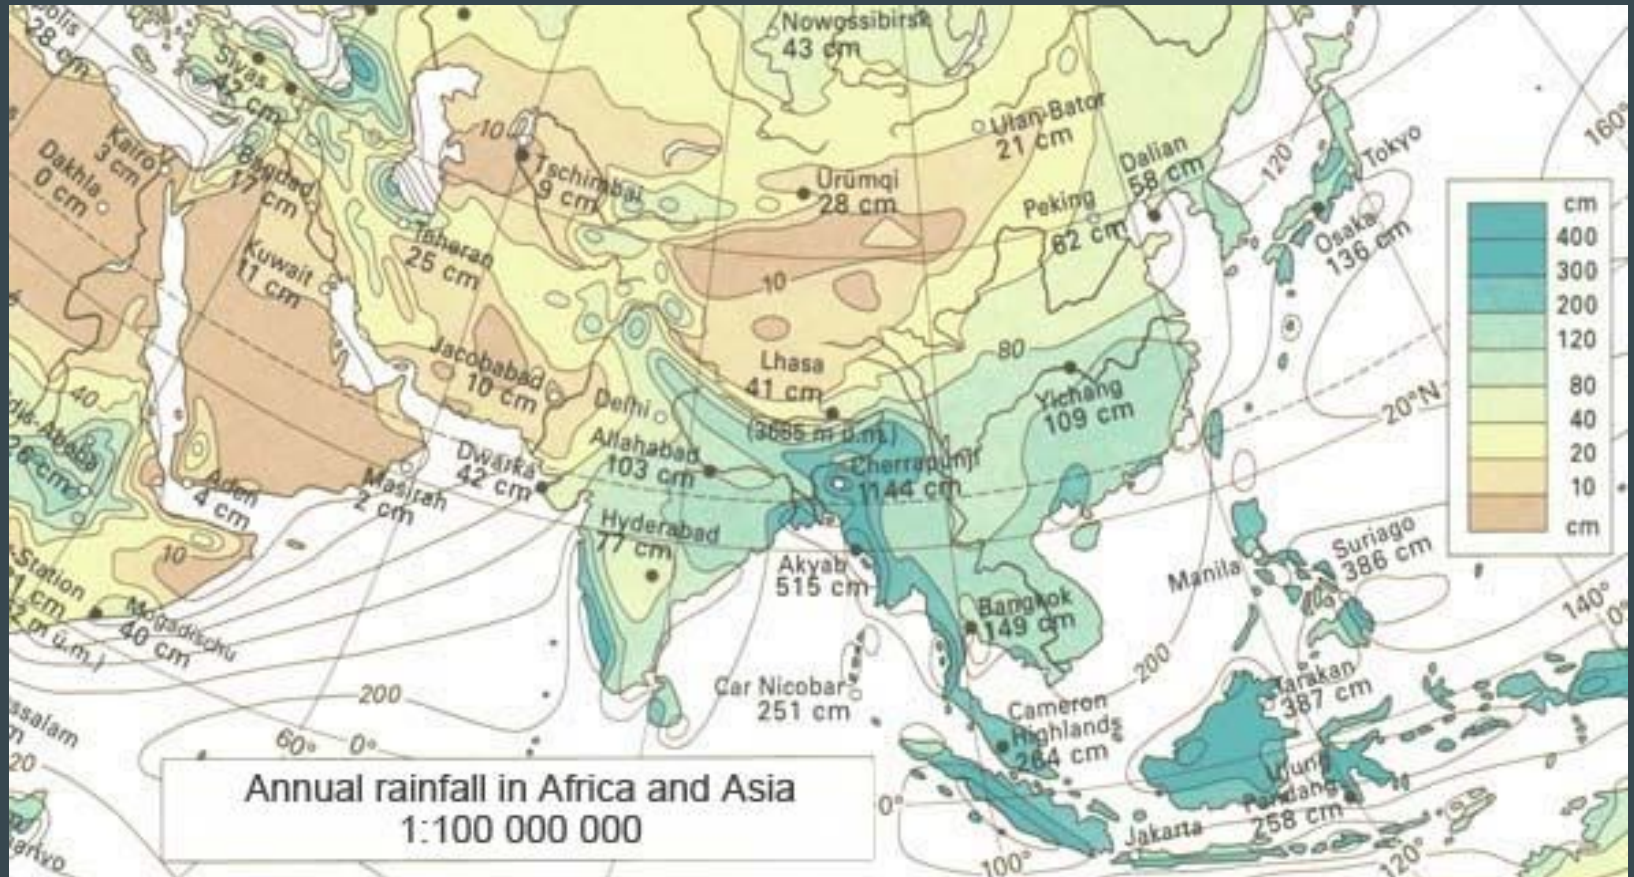

An Isoline Map is a way of presenting numerical data cartographically.

Applications

- Climate
- Population
- Geography

Geographical Applications

Examples

<https://datavizproject.com/data-type/isoline-map/>

Advantages & Disadvantages

ADVANTAGES

1. It is accuracy and quantitatively interpreted since using numbers.
2. It is more useful in climatic data presentation such as temperature, pressure, and rainfalls by using lines.
3. 3. It is easy to interpret, attractive and flexible.
4. 4. They can be superimposed in other maps without obscuring some of the features.

DISADVANTAGES

1. It is confusing when there is large list of points or dots.
2. The accuracy is missing as they involve interpolation which is subjective
3. It is time consuming when there is large number of dots or points.
4. It is difficult to design an interval when points or numbers in the list not supportive.
5. It is tiresome to read due to the uses of dots which needs extra observation

Variations

- Isobars
- Isotherm
- Isochrome
